USER RESEARCH & ACCESSIBILITY AUDIT

A preliminary heuristic review of the EdVyro student dashboard

Prepared by: Deva Dharshini M

Project type: UI/UX Design Internship — Task 2

Review method: Screenshot-based heuristic review

Evidence scope: Three screenshots supplied by the student showing the EdVyro task page and submission form.

Important scope note

This is a preliminary review of the visible screens in the supplied screenshots, not a complete live-site accessibility evaluation. No interviews or survey responses were collected for this version. Items that cannot be confirmed from screenshots are marked **Not tested** rather than presented as facts. A follow-up live check is recommended before treating findings as final.

1. Objective

Understand how a student navigates the EdVyro task instructions and reaches the project-submission form, identify visible usability and accessibility risks, and propose improvements that can be checked through later testing.

2. Target user

Primary user: a college student completing an online internship task on an Android phone, who needs to understand the requirements, prepare a research/audit report, and submit one reviewable link without confusion.

3. Research questions for a future student check

1. How easy is it to understand what the task requires?
2. Can you find the required deliverable and submission instructions quickly?
3. Is it clear that the submission field expects a URL rather than an uploaded file?
4. Can you read the task instructions comfortably on your phone?
5. What would you change to make completing and submitting the task easier?

Research status: These are proposed questions. No participant answers are claimed in this report. The evidence method used here is the documented screenshot-based heuristic review.

4. Heuristic review findings

Area	Screenshot-based observation	Potential user impact	Suggested improvement / status
Navigation	The bottom navigation shows Home, Tasks, Submit, Coach and More. The selected Tasks/Submit tab is visually highlighted in the supplied screens.	The main sections are visible, but a beginner may not know whether to finish reading the task or move directly to Submit.	Keep the active tab obvious and add a clear in-task action such as “Go to submission” after the checklist. Verify navigation labels with a student.
Readability	The task page uses headings, numbered steps and separate information cards. Some body text appears light grey against a pale background in the screenshots.	Some users may need extra effort to read long instructions on a phone, especially at lower screen brightness.	Use darker body text, comfortable font size and line spacing. Contrast has not been numerically measured; test the live page with a contrast checker.
Contrast	Blue action elements and pale panels are visually distinct, but screenshot inspection alone cannot confirm WCAG contrast ratios.	Low contrast, if present, may make instructions or controls harder to perceive.	Measure text and button contrast on the live page. Aim for WCAG AA: 4.5:1 for normal text and 3:1 for large text.
Forms / submission	The submission screen shows a “Project URL” label, a URL-shaped placeholder, and a “Submit for review” button.	The URL expectation is signalled, but the screenshot does not show validation, error messages, or what happens after submission.	Add an example URL format, explain accepted link types, show clear errors for invalid/empty links, and display a success confirmation. Error behaviour is not tested.
Mobile usability	The screenshots show a narrow mobile layout with stacked cards and a large submit button. The bottom navigation remains visible.	The main controls look reachable, but overlap, scrolling, keyboard behaviour and small-screen resizing cannot be fully verified from static screenshots.	Test on a real phone: scroll to the button, focus the URL field, open the keyboard, submit an invalid URL and check that nothing is clipped. Marked not tested.

5. Design problem statement

Students completing internship tasks on a phone need a clear path from understanding the task requirements to submitting a valid project link. If instructions are lengthy, contrast is insufficient, or submission feedback is unclear, students may hesitate or make avoidable submission errors. The screenshot review identifies areas to verify; live testing is needed to confirm how often these issues occur.

6. Prioritised recommendations

• **Priority 1 — Submission clarity:** show a short example of an acceptable view-only URL and explain how to set sharing permissions.

• **Priority 2 — Readability and contrast:** measure contrast and increase text contrast where needed.

• **Priority 3 — Feedback:** test empty/invalid URL behaviour and provide actionable error and success messages.

• **Priority 4 — Mobile checks:** test the full task-to-submit journey on a phone, including scrolling and the on-screen keyboard.

7. Measurable success criteria

1. At least 4 out of 5 student testers can identify the deliverable and required submission format within 60 seconds.

2. At least 4 out of 5 student testers can locate the Project URL field and explain what link they should paste.

3. The URL field and submit button remain visible/usable without clipped content during a mobile check.

4. All normal text and large text combinations checked on the live page meet the applicable WCAG AA contrast target (4.5:1 normal text; 3:1 large text).

5. An empty or invalid URL produces a clear message explaining how to fix the problem; a valid submission produces a clear confirmation.

These are proposed targets, not achieved results. They should be measured in a follow-up test.

8. Limitations and next steps

• This report is based on the three screenshots provided, not a complete inspection of every page or state in the live EdVyro product.

• No interview/survey responses, screen-reader checks, keyboard-only checks, or measured contrast ratios are included.

• Next: open the live dashboard on a phone, repeat the checks above, record pass / needs improvement / not tested, and optionally ask three students the five questions in Section 3.

• Do not describe untested items as confirmed accessibility failures. Update this report if new evidence is collected.

9. Conclusion

The supplied screens provide a clear task structure and a visible submission action. The most useful follow-up checks are submission-link guidance, measured text contrast, error/success feedback, and the complete mobile interaction. This preliminary audit records what is visible and separates it from items that still require testing.
